About

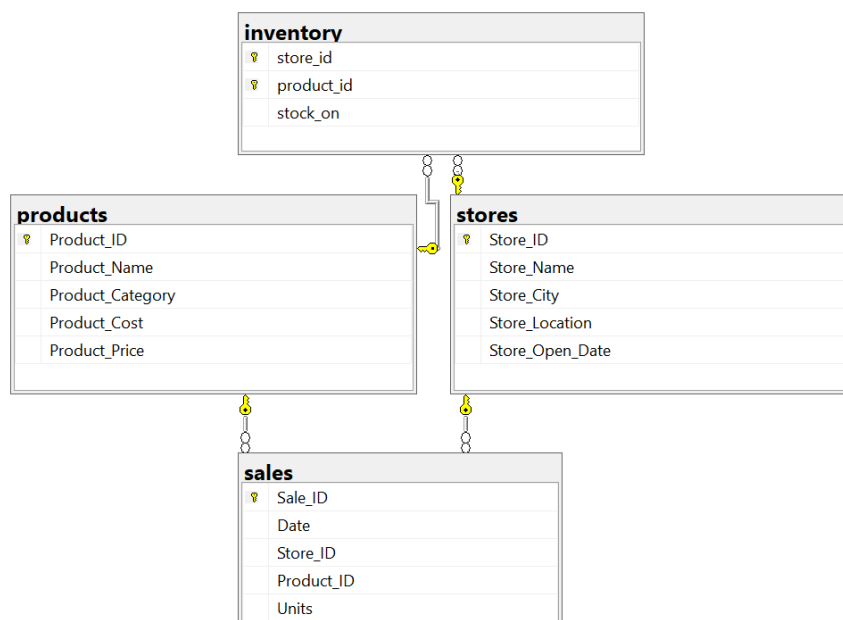

The following dataset describes a fictitious chain of toy stores in Mexico called Maven Toys. The data is stored in four CSV files, each of which contains a different type of data: inventory, products, sales, and stores.

Instructions

As a company analyst for Maven Toys in Mexico, your task is to conduct a data analysis project on the sales and inventory data provided.

Your goal is to provide insights that will help the company make informed decisions.

Data Set

Key Objectives

Here are few examples for recommended analysis:

- Identify the product categories that generate the highest profits and determine whether this varies across store locations.
- Analyze the sales data to identify seasonal trends and patterns. Determine which products sell the most during different seasons and whether there are any trends that the company can capitalize on.
- Determine whether sales are being lost due to out-of-stock products at certain locations. Identify the products that are frequently out of stock and the stores that are affected the most.
- Calculate the amount of money that is tied up in inventory at the toy stores and estimate how long it will last. Identify the slow-moving products and determine whether they need to be restocked or discounted.
